Re: Annual Monitoring Report 2006
Groundwater Quality and Monitoring Well Performance
Monona County Sanitary Landfill
Monona County, Iowa
Permit No. 67-SDP-1-75P
Terracon Project No. 40915034

Dear Mr. Johnston:

Enclosed is a report for the annual monitoring of groundwater quality and monitoring well performance for the Monona County Landfill. This report serves to meet Iowa Department of Natural Resources (IDNR) annual monitoring reporting requirements set forth in IDNR's Regulations for Solid Waste Disposal, Chapter 113. This report does not, however, contain site inspection/special waste authorization information. We understand that site inspection/special waste authorization information is to be reported by Virtue Engineering, the registered design engineer as specified in the landfill's permit (No. 67-SDP-1-75P).

Thank you for the opportunity to be of continued service to you on this project. If there are any questions concerning this report, please contact us.

Sincerely,
TERRACON CONSULTANTS, INC.

1.0 INTRODUCTION

The subject site is an existing landfill operating under Iowa Department of Natural Resources (IDNR) permit number 67-SDP-1-75P, in Monona County of western Iowa. The Monona County Landfill is located within the Southwest $\frac{1}{4}$ of Section 13, in Township 83 North, Range 44 West, in Monona County, Iowa and its location is depicted in Figures 1 and 2 (Appendix A).

Terracon has completed semi-annual water quality sampling and analysis for the 2006 calendar year at the Monona County Landfill in general accordance with the IDNR approved Hydrologic Monitoring System Plan (HMSP), dated February 28, 1995. Semi-annual monitoring consisted of sampling and analyzing groundwater from a total of five water table monitoring wells (one up-gradient well and four down-gradient wells). Surface water sampling and analysis at two locations is also part of the HMSP, but surface water was not present during sampling episodes and was, therefore, not collected. The wells and surface water sampling locations are depicted in Figure 3 (Appendix A). Sampling was performed on the following dates:

- April 21, 2006
- October 12, 2006

Water samples were analyzed for routine annual and semi-annual parameters as specified in Section 113.26(4)e and 113.26(4)f of the Iowa Administrative Code (IAC). Laboratory reports, chain-of-custody documentation, and field data forms have been previously submitted to the IDNR for each semi-annual monitoring event. Copies of these semi-annual documents are retained at the Monona County Landfill.

2.0 STATISTICAL CONSIDERATIONS

Monitoring well MW-5 was considered as the up-gradient location in the water quality monitoring program for semi-annual parameters in groundwater. Surface water was not

collected during the background monitoring period and statistical analyses were, therefore, not performed for surface water.

Statistical evaluation of temperature has not been included since temperature data, to a large degree, is dependent upon ambient conditions. Ambient conditions may cause temperature readings to deviate from actual groundwater conditions as a result of the method used to measure groundwater temperatures. Nevertheless, temperatures recorded during the background sampling events do not indicate obvious indications of temperature fluctuations which may be the result of endothermic or exothermic chemical reactions.

Control bounds were computed in general accordance with guidelines set forth in IAC 113.26(6). One-half of the laboratory practical quantitative limit was used in statistical computations in instances where chemicals were reported at concentrations below the quantitative limit.

Laboratory analytical summary sheets for each sampling location have been provided in Appendix B. Graphs with control limits showing the concentrations versus time for sampling locations are also included in Appendix B. The semi-annual and annual parameters given statistical consideration are as follows:

Chloride	Chemical Oxygen Demand (COD)
Iron (dissolved)	Ammonia Nitrogen
pH	Specific Conductance
Phenols (total)	Total Organic Halogens

3.0 GROUNDWATER IMPACT DISCUSSIONS

Discussion in this section is provided for chemical parameters that fall outside of the upper and lower control limits on a well-by-well basis. Chemical parameters which fall within established control limits are not discussed. Well discussions are presented in reverse order of the well number system (i.e. well MW-5 is discussed first and well MW-1 is discussed last) since this order generally follows an up-gradient to down-gradient progression. Also, well MW-5 is the up-gradient well used for statistical comparison to other wells.

Upper and lower control limits for each of the monitoring wells (MW-1 through MW-5) were based on data obtained for up-gradient well MW-5 as required by IAC Chapter 113.26(6). In some cases, upper and lower control limits are equivalent due to non-detection of certain parameters since monitoring began. In this case, analyte concentrations plot on a single control bound line (no deviation from the mean of the data) instead of between upper and lower control bounds.

3.1 MW-5 (Up-Gradient Well)

Analytes whose concentrations fall outside of the control limits established from up-gradient well MW-5 are as follows:

- **Chemical Oxygen Demand:** The June 29, 1996 data point plotted above the upper control limit. Compared to the other data points on the graph, the data point exceeding the upper control limit appears to be anomalous. Monitoring after the June 29, 1996 measurement indicates that the suspect data point is anomalous and not consistent with other monitoring data for chemical oxygen demand at MW-5.
- **Ammonia Nitrogen:** The October 22, 2003 data point plotted above the upper control limit. Prior and subsequent ammonia concentrations have not been detected in well MW-5 and the October 22, 2003 data point appears to be anomalous at this time.
- **pH:** The October 28, 1997 data point on the pH graph for MW-5 is anomalously low. The anomalous value of this data point may be attributable to error of the field instrument used to measure pH. Monitoring data for sampling events proceeding and subsequent to the October 28, 1997 measurement indicates that the data point is anomalous and not consistent with other monitoring data for pH at MW-5.
- **Specific Conductance:** One data point plotted marginally below the lower control limit and one data point plotted marginally above the upper control limit. These deviations from the control limits are not considered to be statistically significant.

Although chloride concentrations do not fall outside control limits, chloride concentrations have continued to increase since monitoring began in 1995. The reason for the gradual increase is not known; however, a hog confinement facility has been constructed since monitoring began. The hog confinement facility is south and up-gradient of the landfill.

3.2 MW-4 (Down-Gradient Well)

Analytes whose concentrations fall outside of the control limits established from up-gradient well MW-5 are as follows:

- **Iron:** Any detection of iron in a down-gradient well will fall outside the control limits established by up-gradient well MW-5. The June 29, 1996 data point plotted above the control limits but appears to be anomalous, based on data which precedes and

follows the suspect sampling date. The anomalous iron concentration is not consistent with other monitoring data for iron at MW-4.

- **Ammonia Nitrogen:** The October 22, 2003 data point plotted above the upper control limit. The October 12, 2006 data point was near the upper control limit, but not above it.
- **Specific Conductance:** Three early data points plotted marginally below control limits. The remaining data points are within the control limits. The suspect data points do not appear to be statistically significant.

3.3 MW-3 (Down-Gradient Well)

There were no analytes whose concentrations fell outside of the control limits established from up-gradient well MW-5.

3.4 MW-2 (Down-Gradient Well)

Analytes whose concentrations fall outside of the control limits established from up-gradient well MW-5 are as follows:

- **Chloride:** Many of the data points plotted above the upper control limit for chloride. Although the chloride concentrations may be indicative of impact from the landfill, the graph indicates decreasing concentrations since 1999. Data for the past five years has been within control limits.
- **Chemical Oxygen Demand:** The June 29, 1996 and May 2, 2003 data points plotted above the upper control limit for specific conductance. Other data points plotted within the control limits. These two data points do not warrant concern at this time. In particular, the May 2, 2003 data point appears to be anomalous.
- **Iron:** Any detection of iron in a down-gradient well will fall outside the control limits established by up-gradient well MW-5. Four data points randomly plotted above the upper control limit for iron. At this time, it appears that the detections of iron are anomalous and not consistent with other monitoring data for iron at MW-2. Continued monitoring will allow for further assessment of potential iron impact at well MW-2.
- **Ammonia Nitrogen:** The October 15, 1998 data point plotted above the upper control limit for ammonia. It appears that the detection of ammonia is anomalous and not consistent with other monitoring data for ammonia at MW-2.

- **Total Organic Halogens:** Any detection of total organic halogens in a down-gradient well will fall outside the control limits established by up-gradient well MW-5. Detections of total organic halogens have occurred for most monitoring events where sampling and analysis for routine annual parameters was performed. Results are consistent with detection of 1,1,1-trichlorethane (TCA) compounds made during quarterly background monitoring which took place in 1996. TCA concentrations reported at that time were below the Iowa numerical action level of 200 µg/l. The 200 ug/l is currently a numeric standard for protected groundwater sources in Iowa and is also a federal drinking water standard (health advisory level and maximum contaminant level). A review of the graph shows a decreasing concentration trend over the past several years.
- **Specific Conductance:** Several data points plotted above the upper control limit for specific conductance. Based on other indications of groundwater impact at well MW-2 (i.e. total organic halogens and chloride), the specific conductance concentrations may be indicative of impact from the landfill.

3.5 MW-1 (Down-Gradient Well)

Analytes whose concentrations fall outside of the control limits established from up-gradient well MW-5 are as follows:

- **Chemical Oxygen Demand:** The June 29, 1996 data point plotted above the upper control limit for chemical oxygen demand. It appears that the detection is anomalous and not consistent with other most other monitoring data for chemical oxygen demand at MW-1.
- **Iron:** Any detection of iron in a down-gradient well will fall outside the control limits established by up-gradient well MW-5. Dissolved iron has been detected several times since monitoring began in 1995. The detectable iron concentrations plotted above the upper control limit but appear to be sporadic. Based on other indications of groundwater impact at well MW-1 (i.e. total organic halogens), the dissolved iron concentrations may be indicative of impact from the landfill. Over the last three years the data has shown a steady increase in iron concentrations.
- **Ammonia Nitrogen:** Ammonia nitrogen was detected during the October 15, 1998 monitoring event. The detectable ammonia nitrogen concentration plotted marginally above the upper control limit but appears to be anomalous and not consistent with other monitoring data for ammonia nitrogen at MW-1.

- **Total Organic Halogens:** Any detection of total organic halogens in a down-gradient well will fall outside the control limits established by up-gradient well MW-5. Detections of total organic halogens have occurred during several monitoring events where sampling and analysis for routine annual parameters was performed. Specific halogenated VOCs were not detected in groundwater from MW-1 during quarterly background sampling performed in 1996, as they were in groundwater from well MW-2. Wells MW-1 and MW-2 are located at the down-gradient side of the landfill (see Figure 3, Appendix A).
- **Specific Conductance:** Several of the more recent sampling events have revealed specific conductance values plotting above the upper control limit. Continued monitoring will allow for further assessment of recent increased specific conductance at well MW-1.

4.0 MONITORING WELL PERFORMANCE

The current site monitoring instruments were evaluated in general accordance with the approved Hydrologic Monitoring System Plan, dated February 28, 1995. The purpose of this evaluation was to assess whether the integrity of groundwater monitoring instruments is sufficient to adequately monitor groundwater at the landfill as described in the approved HMSP.

4.1 Well Location Evaluation [110.9(2)a]

For the 2006 calendar year, groundwater elevation measurement events for five water table monitoring wells (see Figure 3, Appendix A) were conducted monthly by landfill personnel and during semi-annual monitoring by Terracon. The results of these events have been tabulated in Table 1 (Appendix C).

Water levels at individual wells have remained relatively consistent over the past year. In other words, no significant variation in water level fluctuations have occurred for individual wells over the course of the monitoring period. Water levels at MW-1 and MW-2 have remained within the screened interval throughout the year. Water levels measured in wells MW-3, MW-4, and MW-5 were often times above each well's screened interval. This comparison is made in Table 1 (Appendix C). Water levels outside of the screened interval were within 3 feet of the top of the well screen at well MW-3; within 2 feet of the top of the well screen at well MW-4; and within 2 feet above the well screen in well MW-5.

Ideally, water levels should be within the screened interval for water table monitoring wells, particularly to monitor for the presence of non-aqueous phase liquids (NAPLs) which collect at the water table surface. However, evidence of the presence of NAPLs at the monitoring wells

was not observed in 2006. As long as such evidence of NAPL presence is not observed when the water table is within a few feet above the top of the screened interval, the well will suffice as a viable groundwater monitoring point.

The general direction of groundwater flow was evaluated for each month's data. The general groundwater flow direction has not changed since groundwater flow was assessed in 1993 for the hydrogeologic assessment. To demonstrate this finding, water level data from three arbitrarily selected monitoring dates was used to construct water table contour maps (Figures 4, 5, and 6, Appendix A). The inferred groundwater flow direction shown on these maps is similar to the inferred groundwater flow direction depicted on maps presented in the hydrogeologic assessment report and previous annual groundwater monitoring reports.

Based on the above findings, the monitoring wells' positioning, with respect to well depth (vertical) and also with respect to location along the buried waste perimeter (lateral), continues to be adequate. Up-gradient and down-gradient well designations as described in the HMSP should continue to be used.

4.2 Effects of Landfill Operations on Hydrogeologic Setting [110.9(2)b]

Methods for landfilling of solid waste throughout 2006 have not varied significantly from original landfilling methods employed when landfilling commenced in 1975. Based on groundwater information discussed above in Section 4.1, it does not appear that landfill operations are altering the hydrogeologic setting at the landfill site.

4.3 Well Sedimentation [110.9(2)c]

According to the approved HMSP, well depths need to be measured annually to evaluate whether the wells are physically intact and not filling with sediment. Well depths were measured during semi-annual monitoring events and recorded on IDNR form 542-1322 which accompanied semi-annual analytical reports submitted to the IDNR and retained at the landfill. The results of these measurements, when compared with well depths depicted on boring logs included in the hydrogeologic assessment report (dated February 28, 1995), show that significant silting of site monitoring instruments has not occurred.

4.4 Periodic In-Situ Permeability Tests [110.9(2)d]

According to the approved HMSP, hydraulic conductivities are to be evaluated at monitoring instruments once every five years. Hydraulic conductivity evaluation of the monitoring instruments was performed during November of 1992, October of 1998, and October of 2003. Results of past hydraulic conductivity testing are summarized in Table 3 (Appendix C). Hydraulic conductivity testing is not scheduled to be conducted again until 2008.

5.0 LEACHATE WELL MONITORING

Leachate levels were measured monthly by landfill personnel and during semi-annual monitoring by Terracon during 2006. Results of leachate measurements made at leachate wells (LW-1, LW-2, and LW-3) are summarized in Table 2 (Appendix C). Locations of leachate wells are depicted in Figure 3 (Appendix A). Measured leachate levels in LW-1 and LW-3 did not exceed thicknesses of more than one foot above the bottom of the wells. Measured leachate levels in LW-2 reached a height of 2 feet above the bottom of the well.

6.0 GENERAL COMMENTS

The analysis and opinions expressed in this report are based upon data obtained from the monitoring wells installed at the indicated locations and from any other information discussed in this report. This report does not reflect any variations in subsurface chemistry, stratigraphy, or geohydrology which may occur between wells or across the site. Actual subsurface conditions may vary from those conditions inferred between wells and may not become evident without further exploration.

This report is prepared for the exclusive use of the Monona County Solid Waste Agency for specific application to the project discussed and has been prepared in accordance with generally accepted environmental engineering practices. No warranties, either express or implied, are intended or made. In the event any changes in the nature or location of observed conditions as outlined in this report are found, this report cannot be considered valid unless these changes are reviewed and the opinions of this report are modified or verified in writing by Terracon.

SEMI-ANNUAL AND ANNUAL ROUTINE PARAMETERS STATISTICAL ANALYSIS SHEET

Groundwater Quality Graph for MW-5
(Chloride)

NOTE:

- 1) Results from Monitoring Well MW-5 were used to compute control limits - considered up-gradient well
- 2) One-half of the quantitative limit was graphed for parameters reported at concentrations below their respective PQL.

NOTES:

Values presented above represent leachate thicknesses in feet above the bottom of the respective leachate well.

Leachate levels measured by landfill operator, except for the months of April and October when leachate levels were measured by Terracon.

NM indicates not measured.

"<" indicates less than.

Terracon

Monona County Sanitary Landfill
Monona County, Iowa
Terracon Project No. 40915034

Summary of Hydraulic Conductivity Measurements

DATE	MONITORING WELLS				
	MW-1	MW-2	MW-3	MW-4	MW-5
Nov - 1992	8.10E-05	4.00E-04	4.20E-05	3.00E-05	1.60E-05
Oct - 1998	2.03E-04	1.18E-03	5.53E-05	1.70E-05	2.10E-05
Oct - 2003	1.04E-04	7.27E-05	2.70E-05	2.72E-05	6.07E-05

Hydraulic conductivity values given in units of centimeters per second (cm/sec).
